## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## Listing of Claims:

- 1. (original) A method of driving the gate of an NFET to create a high side switch within a circuit having a charge pump circuit, a first transistor, a second transistor, a third transistor with a base, the first and third transistors having threshold currents, and each transistor electrically connected to an input signal, and a first and second resistor electrically connected to the transistors; comprising:
- driving the charge pump circuit to create a local positive voltage within the circuit;
- deactivating the first and second transistor by providing a input signal below the threshold current of the first transistor; and
- pulling the base of the third transistor high via the first and second resistor to drive current from the local positive voltage into the gate of the NFET.
- 2. (original) The method of claim 1 wherein the charge pump is driven by an oscillator.
- 3. (original) The method of claim 1 wherein the circuit has a diode electrically associated with the local positive voltage.

- 4. (previously presented) The method of claim 3 wherein the diode holds the local positive voltage up when the input signal is high.
- 5. (original) The method of claim 1 wherein the circuit has a logic supply voltage used to supply extra voltage to the local positive voltage.

## 6. - 11. cancelled

>

12. (original) A method of driving a coil of an electrohydraulic valve with a circuit having a charge pump circuit, a first transistor, a second transistor, a third transistor with a base, the first and third transistors having threshold currents, and each transistor electrically connected to an input signal, and a first and second resistor electrically connected to the transistors; comprising:

driving the charge pump circuit to create a local positive voltage within the circuit;

deactivating the first and second transistor by providing a input signal below the threshold current of the first transistor; and

pulling the base of the third transistor high via the first and second resistor to drive current from the local positive voltage into a gate of a NFET thus driving the coil of the electrohydraulic valve.
